

Subject: Certificate of Conformance Requirements in HNF-EP-0063, Revision 12

Generators,

This memo provides guidance on meeting the Certificate of Conformance requirements that have been imposed through the release of HNF-EP-0063, Revision 12. The Certificates of Conformance assist in implementing the following requirements of the Master Documented Safety Analysis (MDSA) and Technical Safety Requirements (TSRs).

- Containers with a potential for hydrogen gas generation are required to be vented. This requirement is not new, but the vent is now considered a safety significant SSC.

As this item is considered safety significant, FH imposed additional controls by requiring generators to certify that their containers and/or vents, as applicable, meet the requirements of HNF-EP-0063. To assist in this certification, Certificate of Conformance forms provide the necessary data to demonstrate compliance. One form is for Project Hanford Management Contract (PHMC) generators and the other for Non-PHMC generators. These forms (or an equivalent form documenting the same information) must be utilized and included as part of each waste package. These forms are located on the Hanford Site Solid Waste Acceptance Program web site ([www.hanford.gov/wastemgt/wac/](http://www.hanford.gov/wastemgt/wac/)).

If you have any questions or would like additional clarification, please contact your waste acceptance representative.
